

How popular are Quonset huts

Quonset huts were first built during the World War II when the constructors began to realize that steel buildings were not only cheap to build but it also took less time than a brick and concrete building to build one. The idea came from military hangars used to safeguard plane and other important assets. These could be easily assembled by hand just like a freighter and in case it had to be moved, it was as easy as taking the structure apart and rebuilding it on a different location just as it was in the previous one. A small team of soldiers was sufficient to assemble, disassemble and reassemble Quonset huts measuring 15 meter long and 6 meters wide. The allies used Quonset huts to protect their soldiers, airplanes, armory and inventory from snow, rain and sunlight.

At the beginning, Quonset huts were neither good looking nor strong. They only served the purpose of being a structure and only in the sixties the construction companies realized that they needed to be stronger and look better too to be a success. This became possible only three decades back when companies invented construction grade steel that was stronger. Quonset huts are in demand today, both on the household and commercial building sector.

Compared to a traditionally built building, Quonset huts have several advantages. They are stronger, safer and cheaper. They are built to easily see a natural disaster like earthquake and hurricane through. Quonset huts are also eco friendly as the material can be reused and recycled in other buildings.

Quonset huts are now another name given to steel buildings. Steel buildings use non traditional building materials like steel sheets, columns and blocks made out of re enforced steel. In traditional buildings, the primary materials used were concrete, bricks and wood. Quonset huts have a higher aesthetic appeal than traditional buildings, they are also stronger, last longer and safer and cost less. Perforated sheets are the most commonly used building material in Quonset huts Quonset huts. The cost and weight of building the structure goes down when perforated sheets are used. Perforated sheets help bring the cost and weight of Quonset huts. Compared to traditionally built sheets, these are easier to bend and to be blended into desired shapes. A lot of people are opting for Quonset huts to build their home, offices and modern buildings. They are every where now, mushroomed into artistic masterpieces and gigantic skyscrapers.

You can now buy Quonset huts as pre fabricated units in various shapes and sizes. An engineer can design Quonset huts on his computer and computer controlled units can create the blocks. It is difficult to tell the difference between Quonset huts and a regular masonry and concrete building. Quonset huts are now also available in many patterns, you can even order one with designer windows, plumbings, roof etc. Some developers have started selling Quonset huts on the internet. These developers also take orders to deliver and assemble a Quonset huts on site. If you plan on placing the order for a Quonset huts online make sure you read the terms of service and the contract very carefully. Check for materials used, time taken to build and labor costs to determine the actual cost of the deal.
